Let us now jump up on the various features that a jigsaw blade carries.

The Varying Blade Shapes:

For the **best jigsaw blade for plywood**, you can have different shapes that can help you assemble your jigsaw firmly, so that you could cut curves on your wood pieces in an efficient and finest way. These are popularly known as shanks. If you take a look on a jigsaw blade, you would come to know that it is either of a T-shape or of a U-shape. Both of them are reliable and are seen as a part of best jigsaws across the market. How to fix them in a jigsaw is a big query, but, we are up here to clear this too.

The T-Shaped Shank: A T-shaped Shank has an apparent "T" on the fixing side of the blade. This kind of a jigsaw blade has an advantage as it facilitates quick blade change whenever you need to. It is because of the vertical screw setup. However, some of the T-shaped blades come up with horizontal fixing system which is also a cool one and you do not have to worry about it. The company that most often develops this kind of a blade shank is Bosch Power Tools.

The U-Shaped Shank: The jigsaw blade that has a U-shaped shank is another secure blade that you can have for your jigsaw. There are two things that help attach this U-shaped blade onto the jigsaw. First is the locking screw that helps hold the blade tightly, and the second is the Hex-Key which is situated with the jigsaw that supports U-shaped shank. This key helps to drive the screw, making the blade tightly fixed on the jigsaw. The Black and Decker Tool Company features the jigsaws that support U-shaped blade shanks.

Contrast in Material:

Yet another feature to observe in a jigsaw blade is the material variety. You can have stiffer, firm, and the **best jigsaw blade for plywood** or even for cutting metal if you opt to consider its stuff type. Different Tool Companies make different blades as per the material. Few can disappoint you but, there are some of them that are completely exceptional. You can see their briefing below:

High Carbon Steel (HCS): The High Carbon Steel is one of the most flexible blade material that the tool companies use in the fabrication of the jigsaw blades. Apart from its flexible behavior, the thing that may annoy you is the quick tearing out of the blade material.

High Speed Steel (HSS): If you are looking for a durable and stiff blade for your jigsaw, the High Speed Steel (HSS) material is the most favorable. As this stuff looks a little obdurate which is why you can have good cuts on plywood, metallic pieces, hardwood, etc.

Tungsten Carbide: When you look for the perfect match blade for your jigsaw, the Tungsten Carbide blade comes directly in the mind. Even if you are aiming to cut tiles, metal, ceramics, glass, or wood, the Tungsten Carbide blade can be your ideal companion. The best thing to note about this stuff is the heat resistance.

Bi-Metallic Blades: As the name implies, a bi-metallic blade formulates with a mixture of two metal elements (you can also call it an alloy). There is no such material that this sturdy blade substance can't cut. All you need is to have one for your jigsaw and examine its long-lasting strength.

What is TPI in a Jigsaw Blade?

A jigsaw blade does not only possess diversity in its material quality and shape, but another thing which is notable is the TPI which also changes from blade to blade. However, the TPI does not reflect upon the material of the blade. What actually TPI is? To elaborate, we can say "Teeth Per Inch" of a jigsaw blade. It is more than clear that having teeth is the first and the most essential part of a blade so that material can be cut in curves in an efficient way.
